About me

01

I'm Vansh, a B.Tech Computer Science and Engineering student with an AI/ML focus. Right now, I'm exploring the wider computer science world and building a strong foundation before choosing a direction.

I'm interested in how software works, how intelligent systems are made, and the small decisions that turn an idea into something useful. This portfolio is a record of that learning process — not a claim that I have everything figured out.

What I'm exploring

Computer science

Strengthening programming fundamentals and learning how different parts of technology connect.

AI / machine learning

Following the ideas behind intelligent systems with curiosity and a practical mindset.

Building in public

Turning experiments and lessons into a visible trail of steady progress.

Creative problem solving

Using patience, structure, and different perspectives to understand a problem well.

A little more personal

“ Reading, chess, Sudoku, and music help me slow down, notice patterns, and stay curious outside the screen.

Education

● 2025 — 2029

B.Tech — CSE (AI/ML)

P P Savani University

Currently in the 3rd semester, exploring computer science and building a broad technical foundation.

Current focus

● Now

Exploring the field

Programming · Software · AI / ML

Learning across areas before choosing a specialization that feels meaningful.

Learning mindset

Curiosity

Consistency

Problem solving

Communication

Verified projects will live here as I continue building. For now, this is a quiet placeholder rather than a collection of invented case studies.

[See my GitHub ↗](#)

Projects in progress

I'm exploring ideas and learning the fundamentals needed to build work I can stand behind.

Certificates

01 AI For Everyone

02 AWS

03 Data

04 Generative AI for Everyone

05 Generative AI

06 GitHub

07 Python

08 Web development

This space will hold small notes from the journey — things I'm learning, questions I'm sitting with, and useful links I want to remember.

01 / PERSPECTIVE

It's okay to explore before you specialize.

Being early in the journey is a chance to notice what keeps pulling your attention.

02 / PROCESS

Small, finished experiments beat perfect plans.

A useful next step is often more valuable than a polished five-year answer.

03 / PRACTICE

Curiosity is a technical skill too.

Good questions make the work clearer, especially when the answer is not obvious yet.

Contact

05

If you want to talk about learning, ideas, technology, or a project worth exploring, I'd be happy to hear from you.
